

Fishing Report

Look to go Dolphin Fishing this Summer!

Dolphin—also known as Mahi Mahi

Are really fun to catch and great to eat! Summertime here in the Keys the Dolphin are plentiful! This is the prime target this time of year. Once in awhile you will find a Blue Marlin in with the Dolphin—if your lucky! There may also be Tuna at the Islamorada Hump. Depending on the wind direction and current, yellowtail snapper will be here. Always something to bend the rod here in Islamorada!

Mahi-mahi is one of the fastest-growing fish. They are fast swimmers as well, with a top swimming speed of 50 knots! Mahi-mahi have a lifespan of 4 to 5 years. Catches average 7 to 13 kg (15 to 28 pounds). They seldom exceed 15 kg (33 pounds), and any Mahi-mahi over 18 kg (39 pounds) is exceptional. Mahi-mahi have compressed bodies and long dorsal fins extending almost the entire length of their bodies. They are distinguished by dazzling colors: golden on the sides, bright blues and greens on the sides and back. Mature males also have prominent foreheads protruding well above the body proper. Females have a rounded head. The males and female have similar shaped bodies except for their heads. Females are usually smaller than the males.
